Prior to assembly insert the connector housings into headboard, crossbar and footboard with the slot in the direction of the XS dowels. Insert and turn XS dowels accordingly into side rails.

ASSEMBLY OF THE BEDFRAME

The assembly will be easier if the bed is assembled lying on its side.

1. Connect and fix the headboard part onto the first side rail.
2. Mount the feet to the crossbar.
3. Connect the crossbar to the side rail.
4. Connect and fix footboard to the side rail.
5. Fit the second side rail to the crossbar, head and footboard.

To fix the connectors please use grub screws. If you cannot screw in the grub screw flushly unscrew the XS dowels slightly. Then connect again. Fix right angles of the completely assembled bed and make sure to tighten the connections once more.

SUPPORTS FOR SLATTED BASE

Please note that the support bars can be fixed at three different heights. Use the Confirmat screws to fix the supports to the side elements. We recommend that the mattress protrudes the bed frames by 2 inches. For mattresses wider than 120 cm the center rail must be used. If necessary use the distance block and the screws for the right height. For position 2 place the distance block horizontally, for position 3 rotate the distance block upright. Afterwards mount the height-adjustable center support feet.

Position 1: without distance block

Position 2: distance block horizontal

Position 3: distance block vertical
